

PROJECT FINAL REPORT

1. Background

As we all know at the moment, the biggest problem in every country is the coronavirus. Many problems have arisen due to COVID-19. Patients lack medication. There is not enough space in the infirmaries, everywhere they are crowded. People have no choice but to be treated at home. In these difficult times, people began to share medicines, give information about the availability of certain medicines in pharmacies. We decided to create a service for Kazakhstanis, where all information about medicines in the nearest pharmacies of people in need will be stored on our website. People who want to donate or sell their medicines can also list their medicines.

2. Experience

In the course of this project, we gained big experience in teamwork. We shared tasks in a team and improved our experience in working in the git control version. This allowed us to interact with classmates even at a distance. An even bigger plus in this project was the study of new technologies. Integration of ready-made components as well as automate everything.

3. Problems

The main problems we had were related to the backend part of the project. For example, several functional parts did not work correctly for us. This was due to SQL queries in the database. It was not easy to use the obtained data in the lectures in practice, and to apply them in the project.
